# 1. INTRODUCTION

This document is intended as a guide for designing a Custom I/O board for Osbourne base board. Osbourne is a Jetson AGX Orin module-based board with rich graphics and camera input capability. Osbourne board converts Jetson AGX Orin module into a complete embedded system by providing interface circuitry, I/O connector for all the major features of the module, camera interface, power supply and additional I/O capability.

I/O connector provides flexibility to users to design custom boards based on the application like commercial IO boards or Rugged latching connector-based IO boards.

Refer Osbourne user manual to get more details on features mapped on to the other connectors on the Osbourne base board.

## 1.1 I/O Features and Connector Type

All the I/O signals are routed to a 150pin single I/O Connector board with all circuitries included in the Osbourne base board to have only Passive connectors and minimal components on custom I/O board developed by third parties.

| Main I/O Features   | Description  |
|---------------------|--|
| <b>Power</b>        | 7V-20V wide input supply, typical 18 V   |
| <b>RTC</b>          | 3V power input for RTC functionality   |
| <b>USB</b>          | 4x USB 2.0, 3x USB 3.2   |
| <b>Ethernet</b>     | 1G/2.5G/5G/10G Multi Mode Gigabit Ethernet without on board Magnetics  |
|                     | 10/100/1000Mbps through RGMII adapter board without on board Magnetics   |
| <b>Audio</b>        | Via ALC5640 CODEC  |
| <b>Serial ports</b> | 2 x ports Software configurable RS-232/422/485 through SP336 transceivers with bypass option to access TTL signals |
|                     | 2x ports fixed RS-232 through SP3243 transceivers with bypass option to access TTL signals                         |
| <b>Display</b>      | 1x HDMI 2.0a/b or DP directly from the Module  |
| <b>Digital IOs</b>  | 8 Digital IO via I2C to GPIO   |
| <b>CAN</b>          | 2x CAN with Non isolated transceivers  |
| <b>Utility</b>      | PWR_ON, RESET, FORCE RECOVERY, MEM_ERASE, I2C, SPI   |

### 1.3 Block Diagram of Osbourne Carrier Board

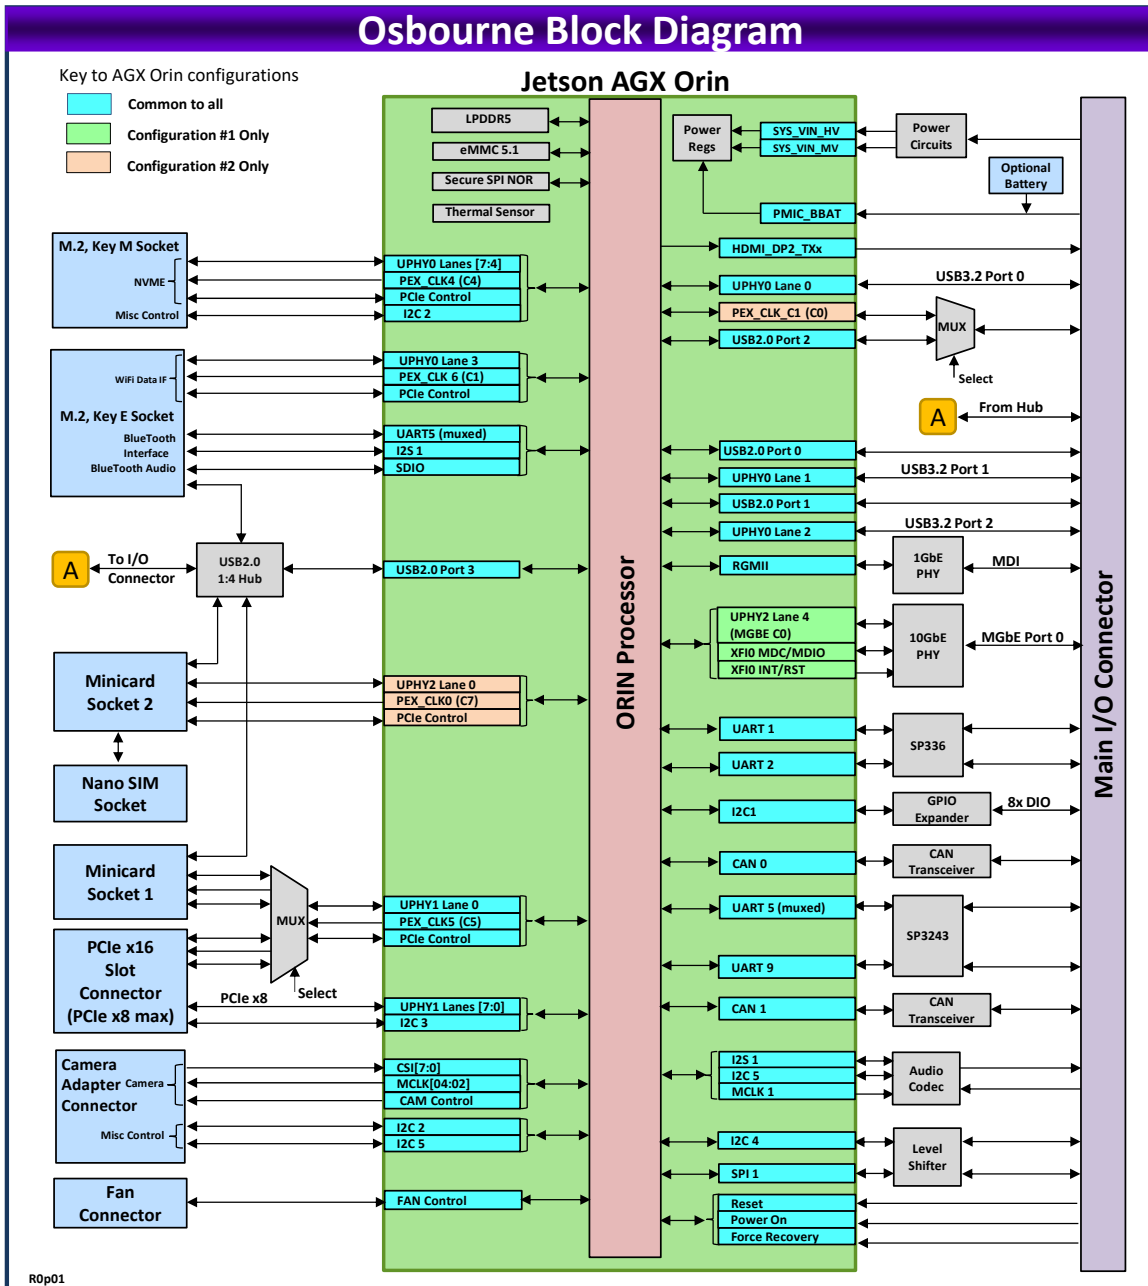

Figure 1: Osbourne Block Diagram

## 2. B2B CONNECTOR DETAILS AND MATED VIEWS

### 2.1 B2B connector details

Part number of IO connector used on the Osbourne baseboard is **ERF8-075-01-L-D-RA-L-TR**, from the Samtec ERM8 Right angle series.

<https://www.samtec.com/products/erm8-ra?EmailTextbox=&FNameTextbox=&LNameTextbox=&auth=1>

Mating Connector on the Custom I/O board can be decided based on in-line and right-angle configuration requirement of the I/O board.

1. Recommended B2B connector part number for in-line connector board is **ERM8-075-01-L-D-RA-L-TR**.
2. Recommended B2B connector part number for right angle connector board is **ERM8-075-02.0-L-DV-TR**  
(Part can be changed be based on the mating height).

### 2.2 B2B Connector Pinouts

| Orin Pin # | Direction wrt Osbourne baseboard | Voltage level / pin type | Signal name           | Pin no. | Pin no. | Signal name          | Voltage level / pin type | Direction wrt Osbourne baseboard | Orin Pin # |
|------------|----------------------------------|--------------------------|-----------------------|---------|---------|----------------------|--------------------------|----------------------------------|------------|
|            | Output                           | Analog Output            | AUDIO_HPOR_HDA        | 1       | 2       | GND_AUD              | Audio Ground             | Ground                           |            |
|            | Output                           | Analog Output            | AUDIO_HPOL_HDA        | 3       | 4       | AUDIO_MIC_L          | Analog Input             | Input                            |            |
|            | Input                            | Power: 1.8V to 3.46V     | V_3P0_RTC_CON         | 5       | 6       | AUDIO_MIC_R          | Analog Input             | Input                            |            |
|            | Output                           | Power: 5.0V              | V_5P0_A               | 7       | 8       | AUDIO_PRSENT_L       | 1.8 V                    | Input                            |            |
|            | Output                           | Power: 3.3V /5.0 V       | V_DIO                 | 9       | 10      | GND_DIG              | Ground                   | Ground                           |            |
|            | Bi-directional                   | V_DIO                    | DIO_PA7               | 11      | 12      | USB3/PCIE_UPHY_RX0_P | USB3 / PCIe Diff pair    | Input                            | A22        |
|            | Bi-directional                   | V_DIO                    | DIO_PA6               | 13      | 14      | USB3/PCIE_UPHY_RX0_N | USB3 / PCIe Diff pair    | Input                            | A23        |
|            | Bi-directional                   | V_DIO                    | DIO_PA5               | 15      | 16      | GND_DIG              | Ground                   | Ground                           |            |

Figure 3: Osbourne Main Board and Sample I/O Board Mated View

Note: Mounting bracket part#**6882643** can be used to attach the Osbourne base board with the sample I/O board. The positioning of mounting holes and I/O connector should match Figure 3, If user wants to use mounting bracket to attach the Osbourne base board with the custom I/O board.

Recommended PCB thickness to match the Osbourne carrier board for in-line configuration is 2.3mm.

Figure 4: Osbourne Carrier Board with Osbourne Panel IO Board with PCB thickness for reference

### 3. MECHANICAL DRAWINGS OF OSBOURNE CARRIER BOARD

Figure 5: Osbourne Carrier Board - Top Dimension

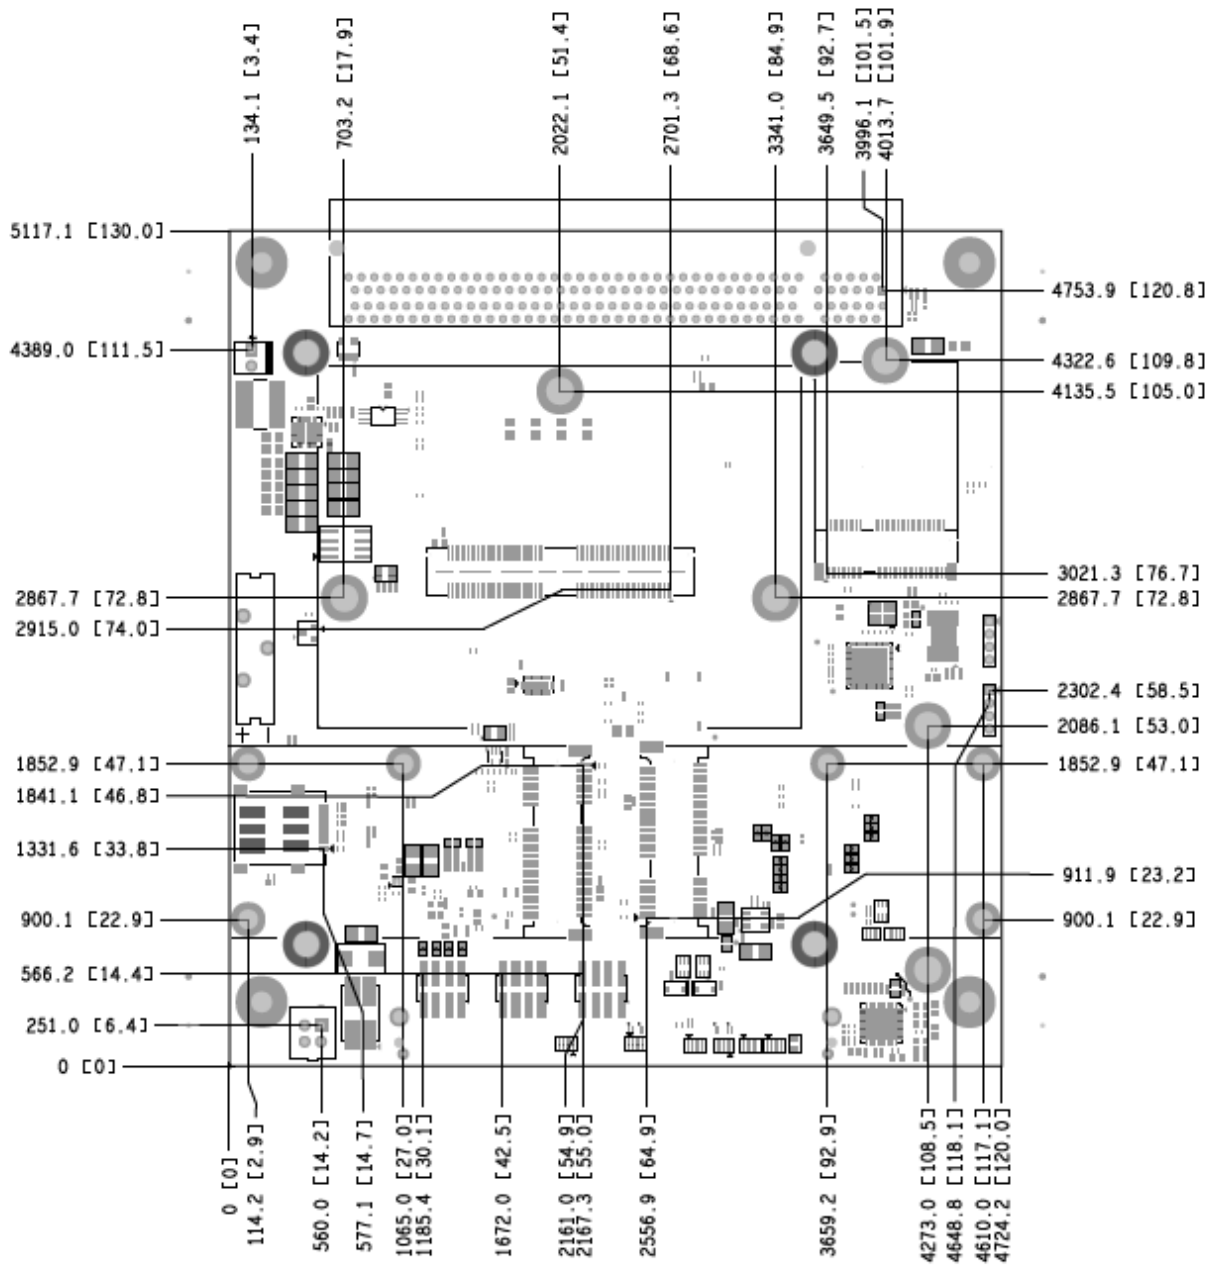

Figure 6: Osbourne Carrier Board - Bottom Dimension

## 4. DESIGN CONSIDERATIONS FOR THE VARIOUS I/O CIRCUITS

### 4.1 Power Supply

The Osbourne board can be powered from wide input voltage range of +7V to +20V, typically 18V. Supply input should be greater than 15V if PCIe x16 card is being used on the Osbourne board. The Input power supply is connected to pins 143 through 150 of I/O connector.

The Osbourne carrier board also provides 5V and 3.3V output voltages each with 100mA capacity on the I/O connector and these voltages can be used on custom IO board.

| I/O Conn. Pin | Signal Name | Voltage Level/Pin Type | Description  |
|---------------|-------------|------------------------|--|
| 143           | V_VIN       | Power: 7-20V           | Connect to 7-20V or typical 18V input, 40W power supply +Ve      |
| 145           | V_VIN       | Power: 7-20V           |  |
| 147           | V_VIN       | Power: 7-20V           |  |
| 149           | V_VIN       | Power: 7-20V           |  |
| 144           | V_VIN       | Power: 7-20V           |  |
| 146           | V_VIN       | Power: 7-20V           |  |
| 148           | V_VIN       | Power: 7-20V           |  |
| 150           | V_VIN       | Power: 7-20V           |  |
| 7             | V_5P0_A     | Power: 5.0V            | 5V, 100mA Output – Can be used for HDMI power                    |
| 9             | V_DIO       | Power: 3.3V /5.0 V     | 3.3V, 100mA Output – Can be used for digital peripheral circuits |

Connect supply -Ve to GND pins on the Osbourne board.

| I/O Conn. Pin | Signal Name | Voltage Level/Pin Type | Description                       |
|---------------|-------------|------------------------|-----------------------------------|
| 02            | GND_AUD     | Audio Ground           | Connect to Audio ground           |

| 142           | GND_DIG     | Ground                 |                                   |

#### 4.1.1 Power routing through panel IO board to main board

By default, input voltage to the Osbourne carrier board is supplied from the IO board through IO connector. Custom IO board should have a power input connector that supports +7V to +20V, 40W power input.

Maximum allowable reflected ripple, measured at the voltage input connector is 50mV p-p. Over current protection, Bulk capacitor, EMI filter and reverse protection should be provided on the custom I/O board developed. Refer Figure 7: Power Input Sample Circuit for sample input filter circuitry.

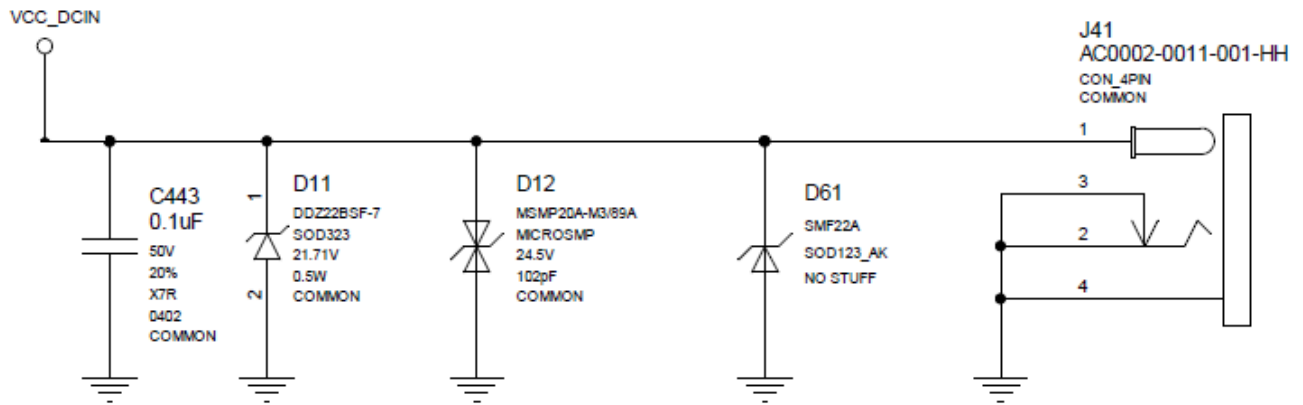

Figure 7: Power Input Sample Circuit

#### 4.1.2 Power routing from main board to panel IO board

For testing purpose an auxiliary 2x2 IPL1 series power connector (J14) is provided on the Osbourne carrier board. The input voltage can be supplied to Osbourne board through this connector if it is not supplied from the custom IO board. The input voltage range is 7-20VD. The connector details and the pinouts for power input are as shown below:

|     |   |   |     |
|-----|---|---|-----|
| VIN | 1 | 2 | GND |
| VIN | 3 | 4 | GND |

Connector part number: IPL1-102-01-L-D-K  
Mating connector: Samtec IPD1-02-D-K  
Mating Cable: DSC # 6981507

#### 4.2 Backup Battery

RTC of Orin module requires backup voltage from 1.85V to 5.5V max. The backup voltage signal is available on IO connector to connect external backup battery. Connect a Lithium Cell or similar power source. The board supports only non-rechargeable coin cells. The base board can boot and function normally without a backup battery as well. This is achieved by OR'ing circuit implemented on Osbourne base board. Figure 8 shows the OR'ing circuit implementation on Osbourne base board.

| I/O Conn. Pin | Signal Name   | Voltage Level/Pin Type | Description   |
|---------------|---------------|------------------------|---|
| 5             | V_3P0_RTC_CON | Power: 1.8V to 5.5V    | Connect coin cell +Ve to this pin through OR'ing circuit and -Ve to GND |

Figure 8: Coin cell OR'ing circuit

Note: 1K series resistor is also available on the Osbourne base board along with OR'ing circuitry.

#### 4.3 Ethernet

The Osbourne board offers Two ethernet port one supports 1G and other supports the 10G ethernet speed.

10G Ethernet port derived using MGBE interface from Orin module using 10G ethernet PHY (part AQR113-B0-I). Three LED signals provided for Link, Activity, and Speed Indication.

The 10/100/1000 Ethernet port uses RGMII interface from Orin module through 1G PHY. Two LED signals are provided for Link, Activity, and Speed Indication.

Note: The Custom I/O board should have 10G and 1G magnetics along with the respective connector.

Both 10G and 1G port signals are routed to IO connector through following pins.

| I/O Conn . Pin | Signal Name   | Voltage Level/Pin Type       | Recommended Impedance | Description                                 |
|----------------|---------------|------------------------------|-----------------------|---|
| 96             | GBE_MDIO_P    | 1G Copper Diff pair          | 100ohm                | Connect to RJ45 pin through a 1G magnetics  |
| 98             | GBE_MDIO_N    | 1G Copper Diff pair          | 100ohm                |   |
| 102            | GBE_MDII_P    | 1G Copper Diff pair          | 100ohm                | Connect to RJ45 pin through a 1G magnetics  |
| 104            | GBE_MDII_N    | 1G Copper Diff pair          | 100ohm                |   |
| 108            | GBE_MDII2_P   | 1G Copper Diff pair          | 100ohm                | Connect to RJ45 pin through a 1G magnetics  |
| 110            | GBE_MDII2_N   | 1G Copper Diff pair          | 100ohm                |   |
| 114            | GBE_MDII3_P   | 1G Copper Diff pair          | 100ohm                | Connect to RJ45 pin through a 1G magnetics  |
| 116            | GBE_MDII3_N   | 1G Copper Diff pair          | 100ohm                |   |
| 120            | MGBE0_PHY_A_P | 10G Copper Diff pair         | 100ohm                | Connect to RJ45 pin through a 10G magnetics |
| 122            | MGBE0_PHY_A_N | 10G Copper Diff pair         | 100ohm                |   |
| 126            | MGBE0_PHY_B_P | 10G Copper Diff pair         | 100ohm                | Connect to RJ45 pin through a 10G magnetics |
| 128            | MGBE0_PHY_B_N | 10G Copper Diff pair         | 100ohm                |   |
| 132            | MGBE0_PHY_C_N | 10G Copper Diff pair         | 100ohm                | Connect to RJ45 pin through a 10G magnetics |
| 134            | MGBE0_PHY_C_P | 10G Copper Diff pair         | 100ohm                |   |
| 138            | MGBE0_PHY_D_P | 10G Copper Diff pair         | 100ohm                | Connect to RJ45 pin through a 10G magnetics |
| 140            | MGBE0_PHY_D_N | 10G Copper Diff pair         | 100ohm                |   |
| 129            | KSZ_LED2      | 1.8 V Active Low             | 50ohm                 | 1G PHY LED2                                 |
| 131            | KSZ_LED1      | 1.8 V Active Low             | 50ohm                 | 1G PHY LED1                                 |
| 133            | MGBE_LED2     | Active Low, Open Drain, 20mA | 50ohm                 | 10G PHY LED2                                |
| 135            | MGBE_LED1     | Active Low, Open Drain, 20mA | 50ohm                 | 10G PHY LED1                                |
| 137            | MGBE_LED0     | Active Low, Open Drain, 20mA | 50ohm                 | 10G PHY LED0                                |

### 4.3.1 1G LED Configuration

KSZ\_LED2 and KSZ\_LED1 configuration is as shown in the following table.

| Link/Activity               | Pin State |        | LED Definition |          |
|-----------------------------|-----------|--------|----------------|----------|
|                             | LED2      | LED1   | LED2           | LED1     |
| Link Off                    | H         | H      | OFF            | OFF      |
| 1000 Link/No Activity       | L         | H      | ON             | OFF      |
| 1000 Link/Activity (RX, TX) | Toggle    | H      | Blinking       | OFF      |
| 100 Link/No Activity        | H         | L      | OFF            | ON       |
| 100 Link/Activity (RX, TX)  | H         | Toggle | OFF            | Blinking |
| 10 Link/No Activity         | L         | L      | ON             | ON       |
| 10 Link/Activity (RX, TX)   | Toggle    | Toggle | Blinking       | Blinking |

Note: In Tri-color Dual-LED mode, the KSZ\_LED2 and KSZ\_LED1 pin outputs toggle high pulses for transmit/receive activity indication. At low data rate (e.g., one frame per second), the LED pin drives high (OFF) with a narrow high pulse width of about 640ns. Typically, the LED toggle rate should be <10Hz (100ms clock period or 50ms high pulse width) to be visible to the human eye. A 640ns pulse is not visible. It is recommended to use a pulse stretching circuit on custom I/O board to detect high narrow pulse widths down to 500ns and stretch them to the visible width (e.g., >50ms).

The following Electronic Design web link article has a sample pulse stretching circuit:

<http://electronicdesign.com/lighting/configurable-logic-chip-stretches-pulses-brighten-led-flash>

### 4.3.2 10G LED Configuration

Refer following sample circuit for LED signal connections.

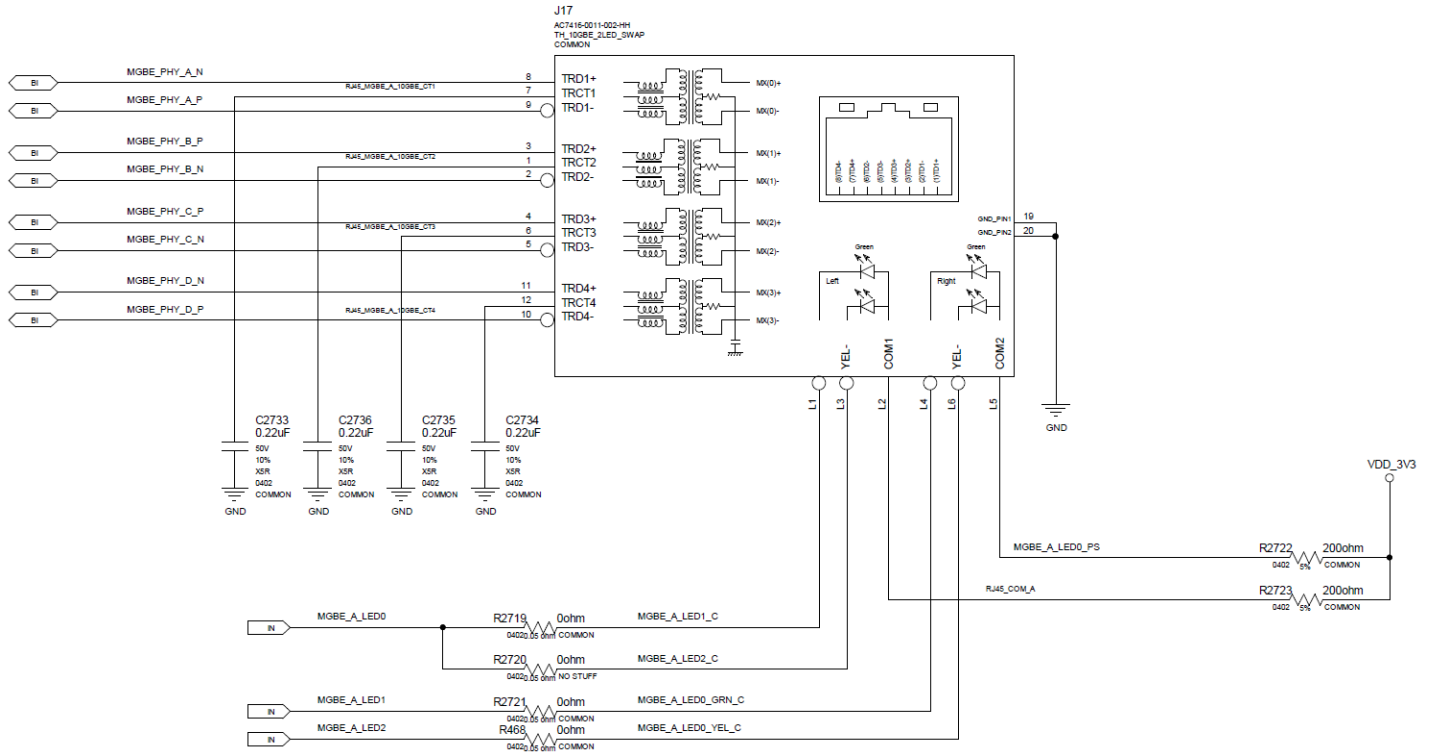

Figure 9: 10G LED Connection Sample Circuit

### 4.4 Display

The board offers one HDMI/DP video output option. The HDMI/DP port is directly from the Module and made available on the I/O connector.

Note: Custom IO board should include level shifter for signals DP2\_AUX\_CH\_P and DP2\_AUX\_CH\_N to change the voltage level from 1.8V/3.3V to 5V.

| I/O Conn. Pin | Signal Name        | Voltage Level/Pin Type        | Recommended Impedance | Description  |
|---------------|--------------------|-------------------------------|-----------------------|--|
| 36            | HDMI_DP2_TX0_CON_P | HDMI/DP Diff pair, AC coupled | 100ohm                | DisplayPort 2 Lane 0 or HDMI Lane 2. AC-Coupled on Osbourne board. |
| 38            | HDMI_DP2_TX0_CON_N | HDMI/DP Diff pair, AC coupled | 100ohm                |  |
| 42            | HDMI_DP2_TX3_CON_P | HDMI/DP Diff pair, AC coupled | 100ohm                | DisplayPort 2 Lane 1 or HDMI Lane 1. AC-Coupled on Osbourne board. |
| 44            | HDMI_DP2_TX3_CON_N | HDMI/DP Diff pair, AC coupled | 100ohm                |  |
| 48            | HDMI_DP2_TX2_CON_N | HDMI/DP Diff pair, AC coupled | 100ohm                | DisplayPort 2 Lane 2 or HDMI Lane 0. AC-Coupled on Osbourne board. |
| 50            | HDMI_DP2_TX2_CON_P | HDMI/DP Diff pair, AC coupled | 100ohm                |  |
| 54            | HDMI_DP2_TX1_CON_N | HDMI/DP Diff pair, AC coupled | 100ohm                |  |

|    |                       |                                  |        |   |
|----|-----------------------|----------------------------------|--------|---|
| 56 | HDMI_DP2_TX1_CON_P    | HDMI/DP Diff pair, AC coupled    | 100ohm | DisplayPort 2 Lane 3 or HDMI Clk Lane. AC-Coupled on Osbourne board.                              |
| 39 | GPIO20_DP/HDMI_EN_1P8 | 1.8 V                            | 50ohm  | Can be used for HDMI/DP Power enable and termination selection through a load switch              |
| 41 | DP2_AUX_CH_P          | Open-Drain, 1.8V (3.3V tolerant) | 90ohm  | Connect to HDMI DDC SCL or DP Aux+ through Level shifter  |
| 43 | DP2_AUX_CH_N          | Open Drain, 1.8V (3.3V tolerant) | 90ohm  | Connect to HDMI DDC SCL or DP Aux- through Level shifter  |
| 45 | HDMI_CEC_CON          | Open Drain, 1.8V (3.3V tolerant) | 50ohm  | Connect to HDMI CEC   |
| 47 | DP2/HDMI_HPD          | CMOS – 1.8V                      | 50ohm  | Connect to HDMI port Hot Plug Detect pin. 10K pull-up to 1.8V is provided on Osbourne base board. |

#### 4.4.1 HDMI Configuration

By default, the configured display interface is HDMI. All the common choke, termination option and ESD protection circuitry are provided on the baseboard. In Figure 10 circuits marked in yellow box is implemented on Osbourne base board. The Custom I/O board should have required circuitry for I2C level shifting, load switch for enabling HDMI power along with the HDMI connector circuit.

Refer Figure 11 for more information on the protection circuit available on Osbourne board.

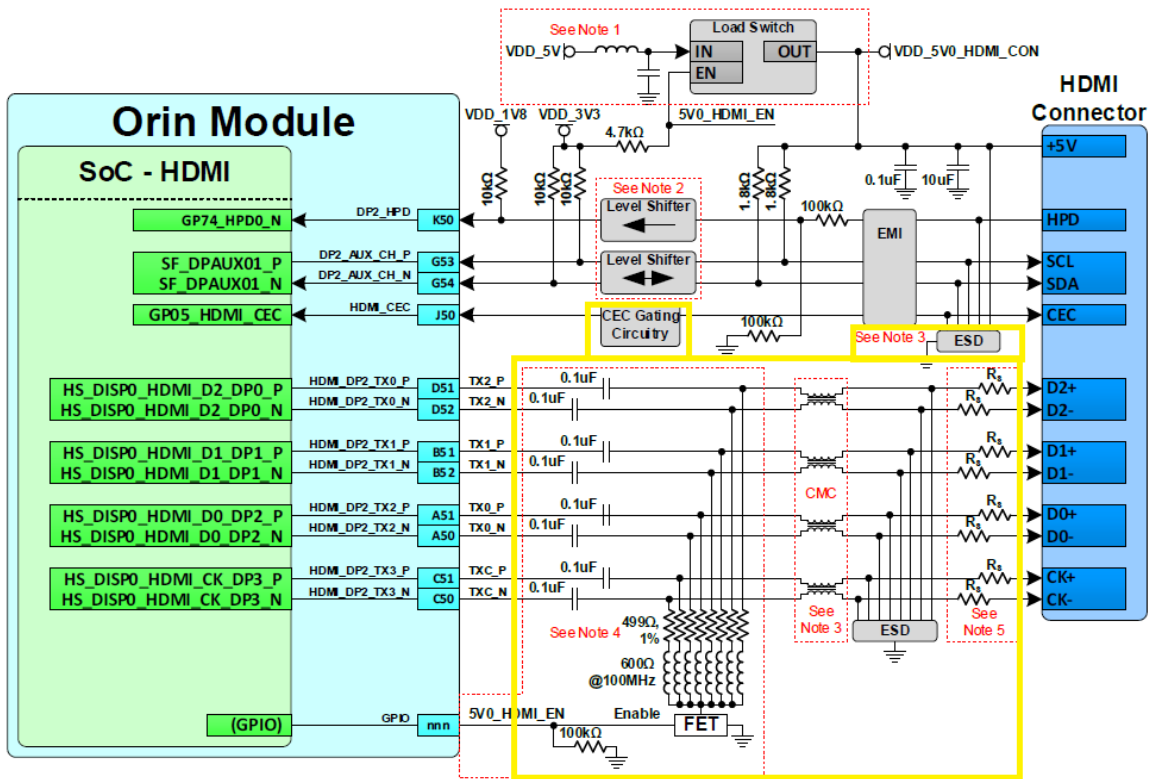

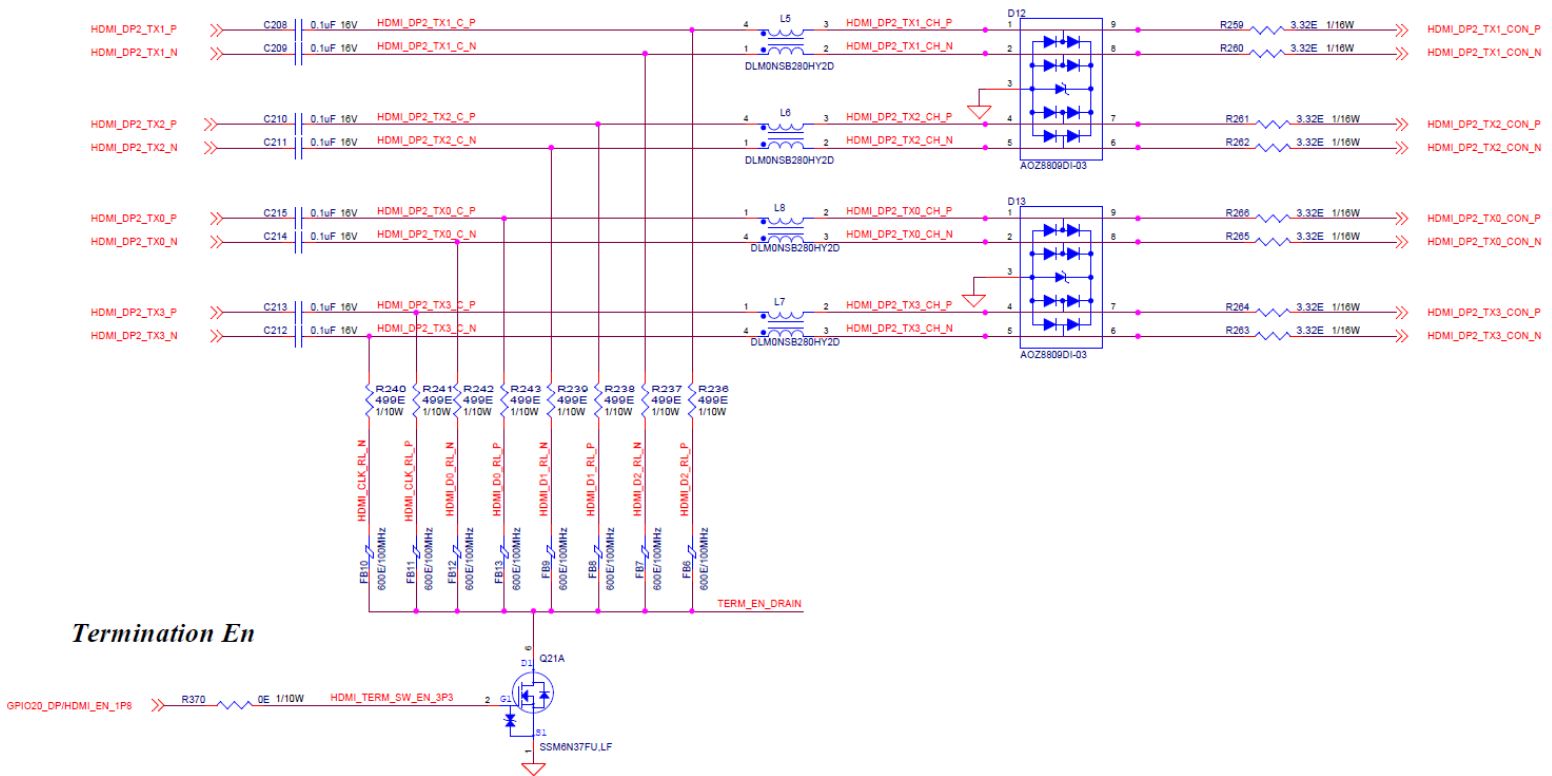

Figure 10: HDMI Configuration

Note 1: The load switch circuit shown is intended to remove power to the HDMI connector and related circuitry to avoid back drive on signals to the module. Other mechanisms may be used but must prevent module pins being driven when the module is off.

Note 2: Level shifters required on DDC/HPD. Orin module pads are not 5V tolerant and cannot directly meet HDMI VIL/VIH requirements. HPD level shifter can be non-inverting or inverting.

Termination En

Figure 11: HDMI/DP Protection Circuit on Osbourne Carrier Board

Note: GPIO20\_DP/HDMI\_EN\_1P8 should be driven low when used as Display Port (DP).

#### 4.4.2 Display Port (DP) or eDP Configuration

The display interface can also be used in DP or eDP mode. Figure 12 shows display port connection example. The section marked in yellow box is implemented on the Osbourne base board. The load switch, level shifters, pull up/down configurations and connector need to be added on the custom IO board.

Figure 12: Display Port Configuration

Note 1: A Level shifter is required on HPD to avoid the pin from being driven when the module is off. The level shifter must be non-inverting (preserve polarity of the signal from the display).

Note 2: Pull-up/down only required for DP - not for eDP.

#### 4.5 Audio

Audio I/O signals include stereo line out and mono/stereo mic in from the CODEC chip (Part# ALC5640). The audio signals made available on the I/O connector. All audio signals should be routed referenced to GND\_AUD on custom I/O board. The Custom I/O board should have suitable protection circuitry to protect against ESD or any other electrical transients.

Figure 13 shows sample ESD protection circuit for individual audio signal lines.

| I/O Conn. Pin | Signal Name    | Voltage Level/Pin Type | Recommended Impedance | Description   |
|---------------|----------------|------------------------|-----------------------|---|
| 1             | AUDIO_HPOR_HDA | Analog Output          | 50ohm                 | Headphone amplifier output right channel                        |
| 3             | AUDIO_HPOL_HDA | Analog Output          | 50ohm                 | Headphone amplifier output left channel                         |
| 2             | GND_AUD        | Audio Ground           |                       | Reference ground for audio signals                              |
| 4             | AUDIO_MIC_L    | 1.8V, Analog Input     | 50ohm                 | Connect to Analog Microphone left channel                       |
| 6             | AUDIO_MIC_R    | 1.8V, Analog Input     | 50ohm                 | Connect to Analog Microphone right channel                      |
| 8             | AUDIO_PRSENT_L | 1.8 V                  | 50ohm                 | Active low Input used to detect a valid audio device connection |

Figure 13: Audio Signal Protection Sample Circuit

Note: It is recommended to use low capacitance ESD diodes, which should not have any impact on the signals within audio frequency band (20Hz to 20KHz). Selection of ESD diode should also maintain the voltage across the diode well within 1.98V DC during ESD events.

#### 4.6 Serial Ports

The board supports up to 4 serial ports from the module. Two serial ports, which can be configured as RS232 or RS422 or RS485 ports, are derived using single transceiver (Part#SP336EEY-L) on the Osbourne carrier board. The protocol selection is done through software control. Refer Osbourne user manual for more information about protocol selection. On board jumper option is provided to select termination (120 Ohm) for RS232/RS422/RS485 protocols. Refer section 386.1.1 for more information on jumper options.

Another Two fixed RS232 protocol ports are derived using another transceiver (Part#MAX3243EIPW) on the Osbourne carrier board. Fourth serial port does not support flow control feature.

The serial transceiver parts used on Osbourne carrier board have in-built protection against ESD up to +/-15kV airgap discharge and minimum +/-8kV contact discharge, hence not necessary to provide any additional protection against ESD on custom I/O board.

| I/O Conn. Pin | Signal Name     | Voltage Level/Pin Type | Recommended Impedance | Description  |
|---------------|-----------------|------------------------|-----------------------|--|
| 49            | UART5_CTS_RS232 | RS232 Signal           | 50ohm                 | Serial Port 3: Connect to CTS pin on DB9 connector |

|    |                  |                     |       |  |
|----|------------------|---------------------|-------|--|
| 51 | UART5_RX_RS232   | RS232 Signal        | 50ohm | Serial Port 3: Connect to RX pin on DB9 connector                                  |
| 53 | UART5_RTS_RS232  | RS232 Signal        | 50ohm | Serial Port 3: Connect to RTS pin on DB9 connector                                 |
| 55 | UART5_TX_RS232   | RS232 Signal        | 50ohm | Serial Port 3: Connect to TX pin on DB9 connector                                  |
| 57 | UART3_9_RX_RS232 | RS232 Signal        | 50ohm | Serial Port 4: Connect to RX pin on DB9 connector                                  |
| 59 | UART3_9_TX_RS232 | RS232 Signal        | 50ohm | Serial Port 4: Connect to TX pin on DB9 connector                                  |
| 81 | CTS2/RX2_N       | RS232/ RS422        | 50ohm | Serial Port 2: Connect to RS232 CTS2/RS422 RX2_N on DB9 connector                  |
| 83 | RX2/RX2_P        | RS232/ RS422        | 50ohm | Serial Port 2: Connect to RS232 RX2/RS422 RX2_NP on DB9 connector                  |
| 85 | RTS2/TX2_N/RX2_N | RS232/ RS422/ RS485 | 50ohm | Serial Port 2: Connect to RS232 RTS2/RS422 TX2_P/ RS485 TX2+,RX2+ on DB9 connector |
| 87 | TX2/TX2_P/RX2_P  | RS232/ RS422/ RS485 | 50ohm | Serial Port 2: Connect to RS232 TX2/RS422 TX2_P/ RS485 TX2+,RX2+ on DB9 connector  |
| 89 | CTS1/RX1_N       | RS232/ RS422        | 50ohm | Serial Port 1: Connect to RS232 CTS1/RS422 RX1_N on DB9 connector                  |
| 91 | RX1/RX1_P        | RS232/ RS422        | 50ohm | Serial Port 1: Connect to RS232 RX1/RS422 RX1_P on DB9 connector                   |
| 93 | RTS1/TX1_N/RX1_N | RS232/ RS422/ RS485 | 50ohm | Serial Port 1: Connect to RS232 RTS1/RS422 TX1_N/ RS485 TX1-,RX1- on DB9 connector |
| 95 | TX1/TX1_P/RX1_P  | RS232/ RS422/ RS485 | 50ohm | Serial Port 1: Connect to RS232 TX1/RS422 TX1_P/ RS485 TX1+,RX1+ on DB9 connector  |

## 4.7 CAN

The board provides two CAN interface from the AGX Orin module to the I/O connector. The CAN transceiver used (Part# MCP2551T-I/SN) supports baud rates from 60 kbaud up to 1 Mbaud. Bi-directional TVS diodes and noise filter circuits are provided on the Osbourne board. Refer Figure 14 for more information on protection available on the CAN bus signals.

| I/O Conn. Pin | Signal Name | Voltage Level/Pin Type | Recommended Impedance | Description                             |
|---------------|-------------|------------------------|-----------------------|---|
| 73            | CAN1_L      | CAN Differential Pair  | 50ohm                 | Connect to CAN LOW line on the CAN BUS  |
| 75            | CAN1_H      | CAN Differential Pair  | 50ohm                 | Connect to CAN HIGH line on the CAN BUS |
| 77            | CAN0_L      | CAN Differential Pair  | 50ohm                 | Connect to CAN LOW line on the CAN BUS  |
| 79            | CAN0_H      | CAN Differential Pair  | 50ohm                 | Connect to CAN HIGH line on the CAN BUS |

Figure 14: CAN filter and protection circuits on Osbourne Board

## 4.8 USB

The Osbourne board supports 1x USB2.0 via USB 2.0 hub routed to I/O connector. Three numbers of USB3.2 and three USB2.0 ports are also routed to the I/O connector. USB power switch, common choke and ESD protection circuitry are provided on the baseboard. One of the USB ports is shared with the PCIe when the Osbourne board work in configuration #2. Refer Nvidia AGX Orin design guide for more information on various configurations. Refer 6.1.3 for more information on jumper configurations. Figure 15 and Figure 16 shows the USB protection circuit available on the Osbourne board for USB2.0 and USB3.2 interfaces respectively.

| I/O Conn Pin | Orin Module Connector Pin No. | Signal Name          | Voltage Level/Pin Type            | Recommended Impedance   | Description                                   |
|--------------|-------------------------------|----------------------|-----------------------------------|---|---|
| 27           | NA                            | V_USB3_1             | Power: 5.0V                       |   | Connect to V+ pin on USB3.2 Port 0 connector  |

\*Not direct connection from Orin module, connected through USB hub circuit

Figure 15: USB2.0 Circuit on Osbourne Carrier Board

**Figure 16: USB 3.2 Circuit on Osbourne Carrier Board**

Note: USB3.2 Port 0 is shared between USB and PCIe. In configuration#1 it is used as USB3.2 and in configuration#2 it is used as PCIe1(C0) port. Refer 6.1.3 for more details on jumper configurations on Osbourne base board.

#### 4.9 Digital I/O

The board provides 8 digital I/O's, which are individually configurable as an output or input. The I/Os are routed to the I/O connector. Figure 17 shows the ESD protection provided on the GPIO lines. Additional protection circuits shall be implemented on Custom I/O board as needed.

Provision is to select the DIO Voltage level of 3.3/5V and configure pull up (10K) and pull down(10K) though the Jumper JP2 is provided. Refer 6.1.2 for more information on jumper configuration.

| I/O Conn Pin | Signal Name | Voltage Level/Pin Type | Recommended Impedance | Description                            |
|--------------|-------------|------------------------|-----------------------|--|
| 11           | DIO_PA7     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 13           | DIO_PA6     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 15           | DIO_PA5     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 17           | DIO_PA4     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 19           | DIO_PA3     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 21           | DIO_PA2     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 23           | DIO_PA1     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |
| 25           | DIO_PA0     | V DIO (3.3V or 5V)     | 50ohm                 | Bi-directional general purpose I/O pin |

**Figure 17: ESD protection on Digital IO Signals**

#### 4.10 SPI

SPI signals are connected to the I/O connector for interfacing external device. On board 1.8V to 3.3V level translator (Part#TXB0108DQSR / NLSX3018MUTAG) shifts SPI signals to 3.3V level. Custom I/O board should have ESD diodes, or any other protection circuitry as needed. Refer Nvidia AGX Orin product design guide for more information on specifications.

| I/O Conn Pin | Orin Module Connector Pin No. | Signal Name | Voltage Level/Pin Type | Recommended Impedance | Description |
|--------------|-------------------------------|-------------|------------------------|-----------------------|-------------|
|--------------|-------------------------------|-------------|------------------------|-----------------------|-------------|

|     |     |               |       |       |  |
|-----|-----|---------------|-------|-------|--|
| 121 | J57 | SPI1_SCK_3P3  | 3.3 V | 50ohm | SPI 1 Serial clock – connect to slave clock pin        |
| 123 | E55 | SPI1_CS0_3P3  | 3.3 V | 50ohm | SPI 1 chip select – connect to slave select pin        |
| 125 | A56 | SPI1_MISO_3P3 | 3.3 V | 50ohm | SPI 1 master in slave out – connect to slave MISO line |
| 127 | D55 | SPI1_MOSI_3P3 | 3.3 V | 50ohm | SPI 1 master out slave in – connect to slave MOSI line |

#### 4.11 I2C

I2C signals are connected to the I/O connector for interfacing external device. On board 1.8V to 3.3V level shifter circuit (Part#TXB0108DQSR / NLSX3018MUTAG) shifts I2C signals to 3.3V level. 2K pull-ups to 3.3V are also provided on both I2C clock and Data lines on Osbourne Carrier board. Custom I/O board should have ESD diodes, or any other protection circuitry as needed. Refer Nvidia AGX Orin product design guide for more information on specifications.

| I/O Conn Pin | Orin Module Connector Pin No. | Signal Name     | Voltage Level/Pin Type | Recommended Impedance | Description                     |
|--------------|-------------------------------|-----------------|------------------------|-----------------------|---------------------------------|
| 97           | E60                           | I2C_GP8_DAT_3P3 | I2C data; 3.3 V        | 50ohm                 | Connect to I2C bus serial data  |
| 99           | D61                           | I2C_GP8_CLK_3P3 | I2C Clock; 3.3 V       | 50ohm                 | Connect to I2C bus serial clock |

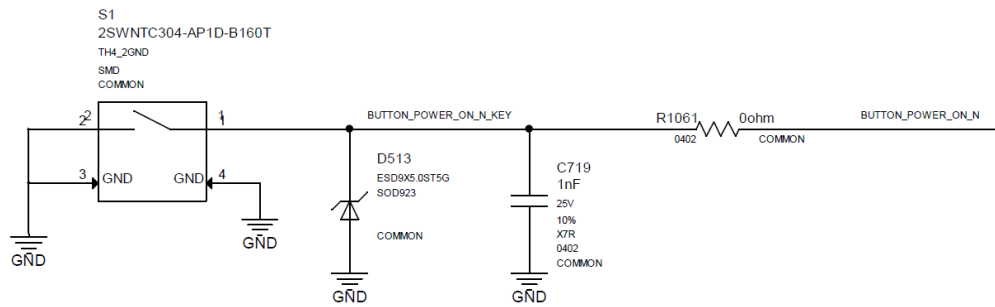

#### 4.12 Power and System Signals

Power and system signal pins such as Power button, Force recovery, Reset are available on the IO connector. Refer Nvidia AGX Orin product design guide for more details. Memory erase signal for M.2 Key M SSD is also available on I/O connector.

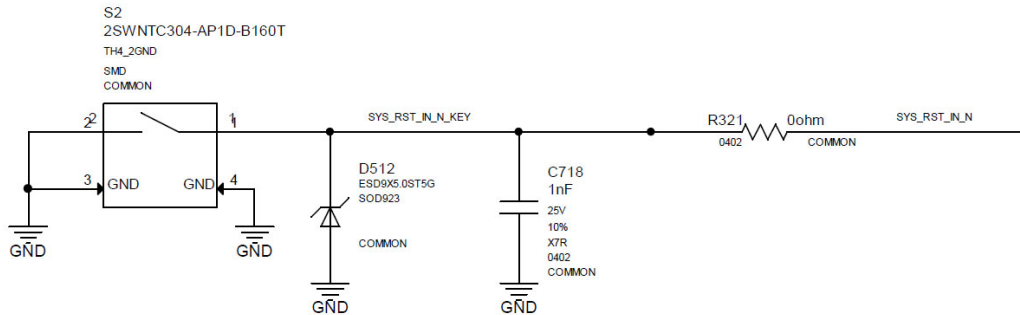

| I/O Conn Pin | Orin Module Connector Pin No. | Signal Name       | Voltage Level/Pin Type | Description  |
|--------------|-------------------------------|-------------------|------------------------|--|
| 101          | L61*                          | BUTTON_POWER_ON_N | 3.3 V                  | Low Input from push button switch enables the power to the system. This feature is currently not enabled on Osbourne base board. Refer Nvidia AGX Orin module design guide for more details.   |
| 103          | L60                           | SYS_RST_IN_N      | Open Drain, 1.8V       | When asserted, the SoC, eMMC, & QSPI are in reset. Refer Nvidia AGX Orin module design guide for more details.   |
| 105          | L10                           | FORCE_RECOVERY#   | CMOS – 1.8V            | Force Recovery strap pin: Held low when SYS_RESET_N goes inactive (power-on or reset button press) to enter force recovery mode. Force recovery mode is used to program Orin module through USB2.0 USB0N/P or USB3.2 port#1. Refer Nvidia AGX Orin module design guide for more details. |
| 111          | B9                            | PEX_C1_RST_N      | Open-Drain, 3.3V       | PCIe Reset for controller #0. 4.7KΩ pull-up to 3.3V on Orin module. This pin is used to reset end point device when UPHY_RX0/TX0 is configured as PCIe x1 (C0) port instead of USB3.2 port.  |
| 113          | NA                            | MEM_ERS_GPIO      | 1.8 V                  | Connected to Pin 6 and 8 of M.2 M Key connector. This functionality is module specific and can be used only on supported modules.  |

\*Not direct connection to Orin module, connected through power sequencer circuit

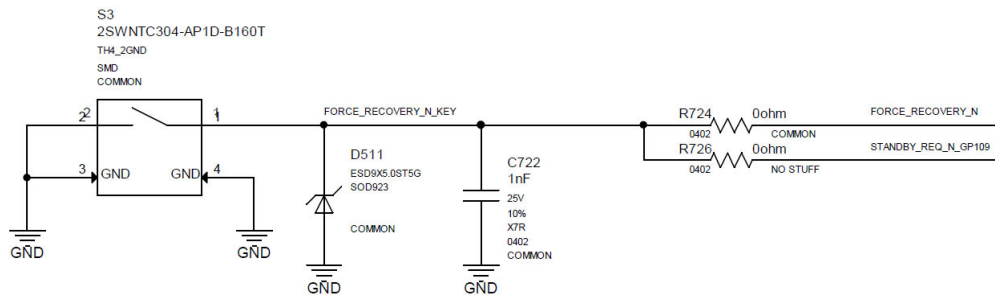

**Figure 18: Button Power ON Sample Circuit**

**Figure 19: Reset Circuit Sample**

**Figure 20: Force Recovery Sample Circuit**

Note: 1nF debouncing capacitor and ESD protection (Part#RCLAMP0524PA) is already available on the Osbourne base board on SYS\_RST\_IN\_N, FORCE\_RECOVERY# and BUTTON\_POWER\_ON\_N signals, so the custom I/O board doesn't need to duplicate these components.

### 4.13 Additional Control GPIOs

Osbourne board provides following GPIOs which can be used for general purposes.

| I/O Conn Pin | Orin Module Connector Pin No. | Signal Name  | Voltage Level/Pin Type | Description   |
|--------------|-------------------------------|--------------|------------------------|---|
| 115          | A48                           | SER_GPIO_SEL | 1.8 V                  | General purpose IO pin from Orin Module. Used as input for multiplexing digital IO and Serial port 2 signals on IO board using analog switch/mux. |
| 117          | H52                           | CAN_SER_SEL2 | 1.8 V                  | General purpose IO pin from Orin Module. Used for multiplexing CAN0 and UART5 signals on IO board using analog switch/mux.                        |
| 119          | D54                           | CAN_SER_SEL1 | 1.8 V                  | General purpose IO pin from Orin Module. Used for multiplexing CAN1 and UART3 signals on IO board using analog switch/mux.                        |

## 5. COMMERCIAL IO BOARD

This section provides details of Osbourne commercial IO board and can be used as a reference to design custom I/O board. Commercial I/O board provides access to all the signals available on the 150pin I/O connector to standard HDMI, USB, RJ45, DB9 and RJ11 type connectors.

### 5.1 Block Diagram for Commercial I/O Board

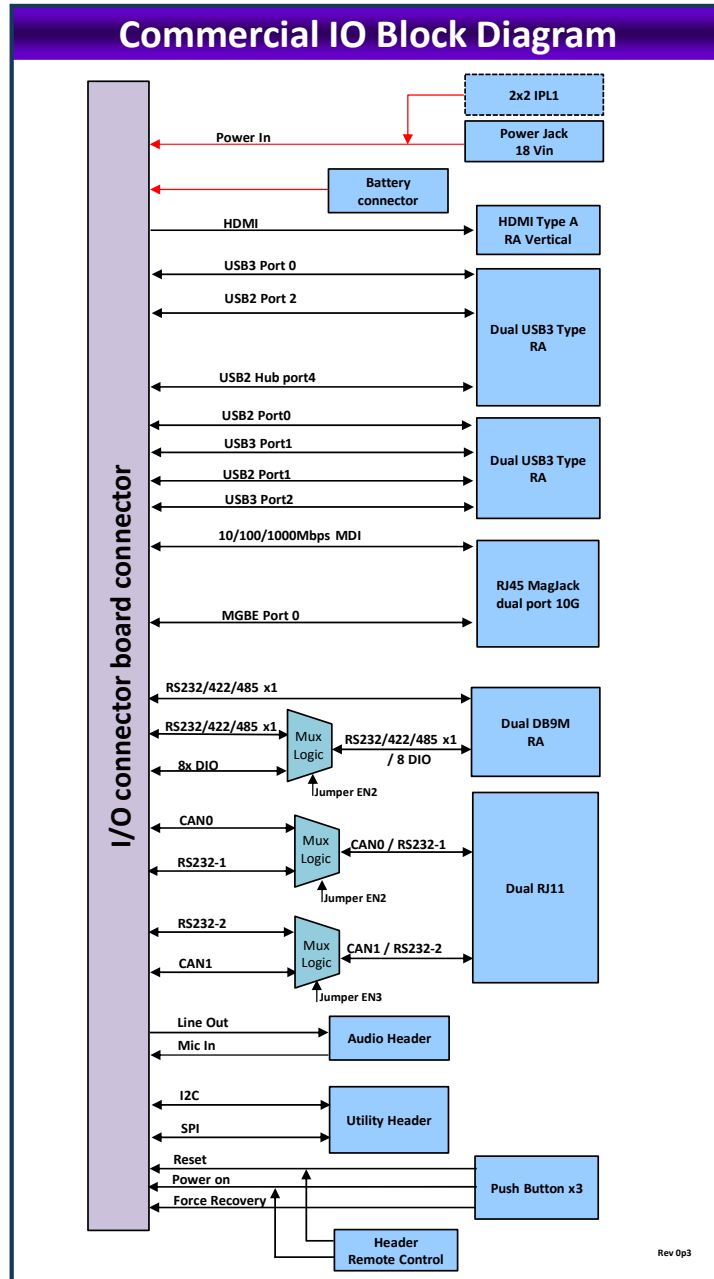

Figure 5-1: Commercial I/O Board Block Diagram

### 5.1.1 Mechanical Drawings for Commercial I/O Board

Figure 5-2: Commercial I/O Mechanical outline

### 5.1.2 Connector and Jumper Location

Figure 5-3: Commercial IO Connector locations

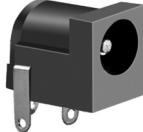

## 5.2 Connector Pinout Specification

### 5.2.1 Power Connector on Osbourne Commercial IO Board

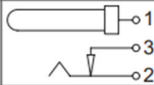

The pinouts for power input are as shown below:

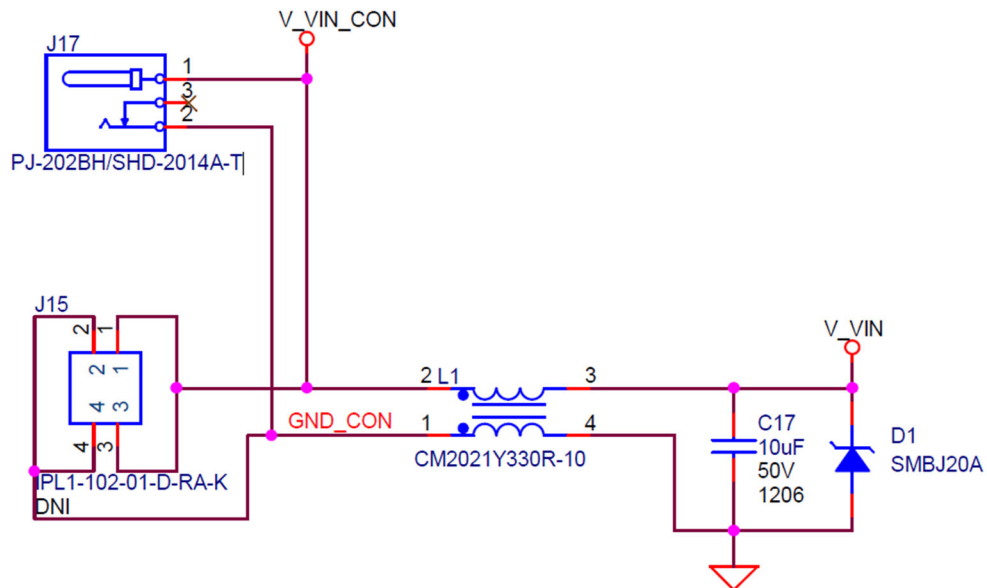

|     |   |
|-----|---|
| VIN | 1 |
|     | 3 |
| GND | 2 |

+VIN = +7V to +20V

|   |  |
|---|--|
| <p>Connector PN: PJ-202BH<br/>Mating Cable PN: Standard 2.5mm DC plug</p> |  |
|---|--|

|            |   |
|------------|---|
| SCHEMATIC  |  |
| Model      | PJ-202BH  |
| Center Pin | Ø2.5 mm   |

**Figure 4: Schematic example for Power Input on Panel IO Board**

Optional latching 2x2 IPI1 series power connector (J15) can be populated instead of Power jack.

### 5.2.2 RTC Connector on Osbourne Commercial IO Board

Two Pin connector is used to connect the external battery.

The pinouts are as shown below:

|               |   |
|---------------|---|
| V_3P0_RTC_CON | 1 |
| GND           | 2 |

**Figure 5: Schematic example for RTC connector on Panel IO Board**

### 5.2.3 Ethernet Connector on Osbourne Commercial IO Board

Dual Port vertically stacked RJ45 connector with inbuilt magnetics are used. The passive components of Led are mounted on the commercial board and MDI signals are routed from main board through I/O connector.

The pinouts of 10G connector are as shown below

|                           |            |
|---------------------------|------------|
| MGBE0_PHY_A_P             | <b>B1</b>  |
| MGBE0_PHY_A_N             | <b>B2</b>  |
| GND                       | <b>B3</b>  |
| MGBE0_PHY_B_P             | <b>B4</b>  |
| MGBE0_PHY_B_N             | <b>B5</b>  |
| GND                       | <b>B6</b>  |
| MGBE0_PHY_C_P             | <b>B7</b>  |
| MGBE0_PHY_C_N             | <b>B8</b>  |
| GND                       | <b>B9</b>  |

## 5.2.4 HDMI Connector on Osbourne Commercial IO Board

The pinouts for power input are as shown below

|                    |    |
|--------------------|----|
| HDMI_DP2_TX0_CON_P | 1  |
| GND                | 2  |
| HDMI_DP2_TX0_CON_N | 3  |
| HDMI_DP2_TX1_CON_P | 4  |
| GND                | 5  |
| HDMI_DP2_TX1_CON_N | 6  |
| HDMI_DP2_TX2_CON_P | 7  |
| GND                | 8  |
| HDMI_DP2_TX2_CON_N | 9  |
| HDMI_DP2_TX3_CON_P | 10 |
| GND                | 11 |
| HDMI_DP2_TX3_CON_N | 12 |
| HDMI_CEC_CON       | 13 |
| RSRVD              | 14 |
| HDMI_SCL_CON       | 15 |
| HDMI_SDA_CON       | 16 |
| GND                | 17 |
| V_5P0_HDMI         | 18 |
| HDMI_HPD_CON       | 19 |

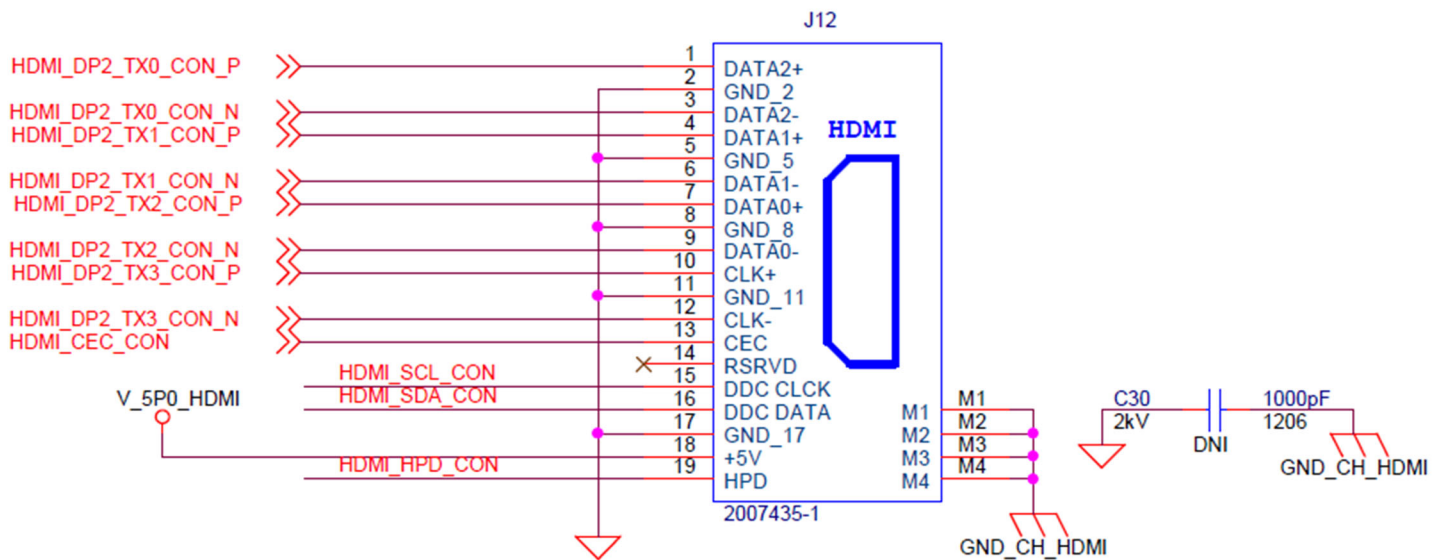

Figure 8: Schematic example for 10G connector on Panel IO Board

### 5.2.5 Audio Connector on Osbourne Commercial IO Board

This connector provides the analog audio interface from the IO connector.

The pinouts are as shown below:

|                |   |    |                |
|----------------|---|----|----------------|
| AUDIO_HPOL_HDA | 1 | 2  | AUDIO_HPOR_HDA |
| GND_AUD        | 3 | 4  | GND_AUD        |
| NC             | 5 | 6  | NC             |
| GND_AUD        | 7 | 8  | GND_AUD        |
| AUDIO_MIC_L    | 9 | 10 | AUDIO_MIC_R    |

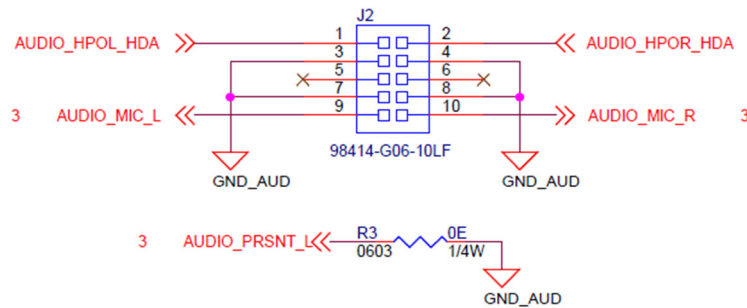

Figure 9: Schematic example for Audio connector on Panel IO Board

### 5.2.6 Serial Connectors on Osbourne Commercial IO Board

The serial ports 1 is routed to dual DB9 bottom port. Serial port 2 muxed with DIO is terminated at dual DB-9 top port. By default, Top port supports GPIO interface and bottom port support Serial port. Configurations can be changed using CAN/Serial/DIO Jumper (JP1). Two hex screws are provided on the DB9 connector to fix the mating connector after attaching.

A dual DB9 connector pin out for serial 1-2 RS232 protocol is below

|         |           |           |         |
|---------|-----------|-----------|---------|
|         | <b>A1</b> | <b>B1</b> | NC      |
| RX2     | <b>A2</b> | <b>B2</b> | RX1     |
| TX2     | <b>A3</b> | <b>B3</b> | TX1     |
|         | <b>A4</b> | <b>B4</b> |         |
| GND_DIG | <b>A5</b> | <b>B5</b> | GND_DIG |
|         | <b>A6</b> | <b>B6</b> |         |
| RTS2    | <b>A7</b> | <b>B7</b> | RTS1    |
| CTS2    | <b>A8</b> | <b>B8</b> | CTS1    |
|         | <b>A9</b> | <b>B9</b> | NC      |

A dual DB9 connector pin out for Serial 1- 2 RS422 protocol is below

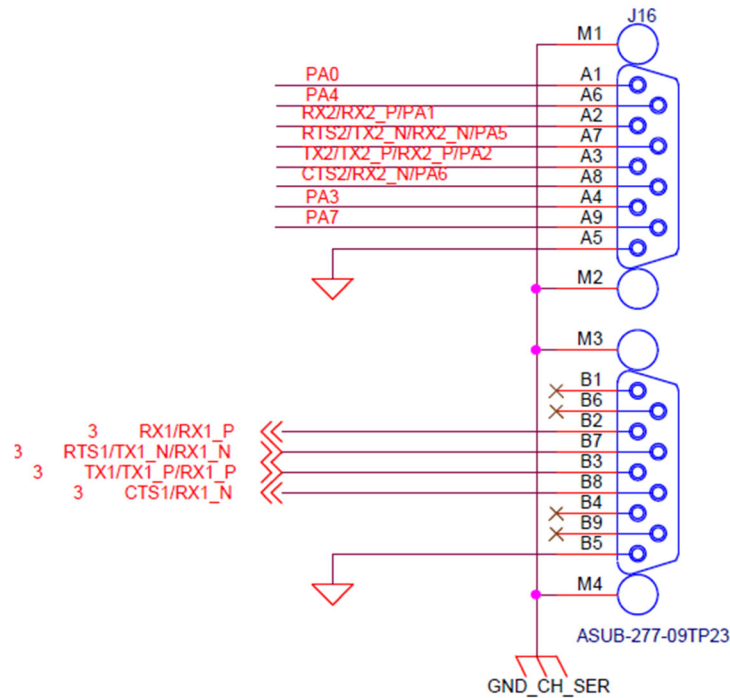

|         |           |           |         |
|---------|-----------|-----------|---------|
|         | <b>A1</b> | <b>B1</b> | NC      |
| RX2_P   | <b>A2</b> | <b>B2</b> | RX1_P   |
| TX2_P   | <b>A3</b> | <b>B3</b> | TX1_P   |
|         | <b>A4</b> | <b>B4</b> |         |
| GND_DIG | <b>A5</b> | <b>B5</b> | GND_DIG |
|         | <b>A6</b> | <b>B6</b> |         |
| TX2_N   | <b>A7</b> | <b>B7</b> | TX1_N   |
| RX2_N   | <b>A8</b> | <b>B8</b> | RX1_N   |
|         | <b>A9</b> | <b>B9</b> | NC      |

A dual DB9 connector pin out for serial 1-2 RS485 protocol is below

|         |           |           |         |
|---------|-----------|-----------|---------|
|         | <b>A1</b> | <b>B1</b> |         |
|         | <b>A2</b> | <b>B2</b> |         |
| RX2_P   | <b>A3</b> | <b>B3</b> | RX1_P   |
|         | <b>A4</b> | <b>B4</b> |         |
| GND_DIG | <b>A5</b> | <b>B5</b> | GND_DIG |
|         | <b>A6</b> | <b>B6</b> |         |
| RX2_N   | <b>A7</b> | <b>B7</b> | RX1_N   |
|         | <b>A8</b> | <b>B8</b> |         |
|         | <b>A9</b> | <b>B9</b> |         |

|   |  |

|---|--|

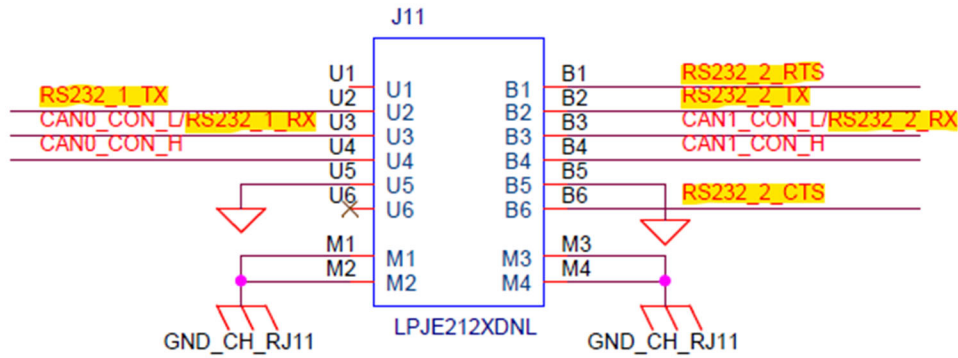

**Figure 10: Schematic example for DB9 Serial connector on Panel IO Board**

The serial ports 3 - 4 are muxed with CAN 1 - 2 and terminated at dual RJ11 connector. By default, CAN interface is supported on both the ports. Configuration can be changed using CAN/Serial/DIO Jumper (JP1).

The pinouts for Serial 3-4 RS232 are as shown below (T = top connector, B = bottom connector):

|            |           |           |              |
|------------|-----------|-----------|--------------|
|            | <b>T1</b> | <b>B1</b> | RS232_2_RTS* |
| RS232_1_TX | <b>T2</b> | <b>B2</b> | RS232_2_TX   |
| RS232_1_RX | <b>T3</b> | <b>B3</b> | RS232_2_RX   |
|            | <b>T4</b> | <b>B4</b> |              |
| GND_DIG    | <b>T5</b> | <b>B5</b> | GND_DIG      |
|            | <b>T6</b> | <b>B6</b> | RS232_2_CTS* |

**Figure 11: Schematic example for RJ11 Serial connector on Panel IO Board**

**Figure 12: USB 3.2 Circuit on Osbourne Carrier Board**

Note: USB3.2 Port 0 is shared between USB and PCIe. In configuration#1 it is used as USB3.2 and in configuration#2 it is used as PClex1(C0) port. Refer 6.1.3 for more details on jumper configurations on Osbourne base board.

### 5.2.7 USB Connectors on Osbourne Commercial IO Board

Two vertically stacked USB 3.2 port are provided on the commercial board with signals routed from the carrier board through I/O connector.

J13 pinouts are as shown below:

|                  |    |
|------------------|----|
| V_USB3_2         | 1  |
| USB2_D0_CH_N     | 2  |
| USB2_D0_CH_P     | 3  |
| GND              | 4  |
| USB3_UPHY_RX1_N  | 5  |
| USB3_UPHY_RX1_P  | 6  |
| GND              | 7  |
| USB3_UPHY_TX1_N  | 8  |
| USB3_UPHY_TX1_P  | 9  |
| V_USB3_3         | 10 |
| USB2_D1_CH_N     | 11 |
| USB2_D1_CH_P     | 12 |
| GND              | 13 |
| USB3_UPHY_RX20_N | 14 |
| USB3_UPHY_RX20_P | 15 |
| GND              | 16 |
| USB3_UPHY_TX20_N | 17 |
| USB3_UPHY_TX20_P | 18 |

J14 pinouts are as shown below:

|                      |    |
|----------------------|----|
| V_USB3_1             | 1  |
| USB2/PCIE_CLK_CH_N   | 2  |
| USB2/PCIE_CLK_CH_P   | 3  |
| V_GND_RST            | 4  |
| USB3/PCIE_UPHY_RX0_N | 5  |
| USB3/PCIE_UPHY_RX0_P | 6  |
| GND                  | 7  |
| USB3/PCIE_UPHY_TX0_N | 8  |
| USB3/PCIE_UPHY_TX0_P | 9  |
| V_USB2_VBUS          | 10 |
| USB2_HUB_D4_CH_N     | 11 |
| USB2_HUB_D4_CH_P     | 12 |

|     |    |
|-----|----|
| GND | 13 |
| NC  | 14 |
| NC  | 15 |
| GND | 16 |
| NC  | 17 |
| NC  | 18 |

Bottom port of J13 can be used for module programming purpose and Top port of J14 supports only USB2.0 interface.

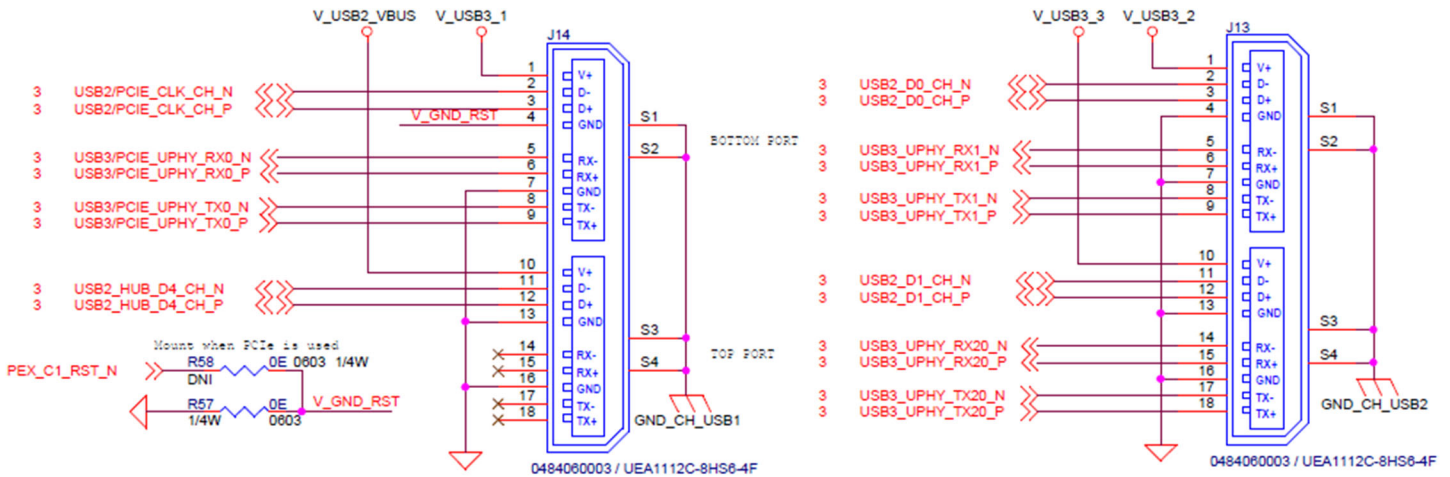

Figure 13: Schematic example for USB connectors on Panel IO Board

### 5.2.8 DIO Connector on Osbourne Commercial IO Board

Serial port 2 muxed with DIO is terminated at dual DB-9 top port. By default, Top port supports GPIO interface and bottom port support Serial port. Configurations can be changed using CAN/Serial/DIO Jumper (JP1).

A dual DB9 connector pin out for DIO is below:

|         |    |    |
|---------|----|----|
| PA0     | A1 | B1 |
| PA1     | A2 | B2 |
| PA2     | A3 | B3 |
| PA3     | A4 | B4 |
| GND_DIG | A5 | B5 |
| PA4     | A6 | B6 |
| PA5     | A7 | B7 |
| PA6     | A8 | B8 |
| PA7     | A9 | B9 |

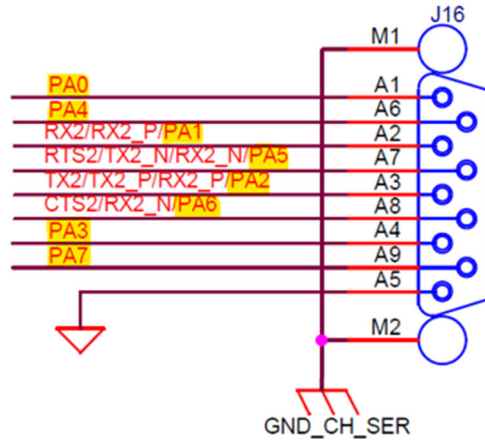

Figure 14: Schematic example for DIO connector on Panel IO Board

### 5.2.9 CAN Connector on Osbourne Commercial IO Board

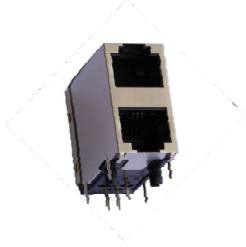

The serial ports 3 - 4 are muxed with CAN 1 - 2 and terminated at dual RJ11 connector. By default, CAN interface is supported on both the ports. Configuration can be changed using CAN/Serial/DIO Jumper (JP1).

The pinouts for CAN 0-1 are as shown below

|            |           |           |            |
|------------|-----------|-----------|------------|
|            | <b>U1</b> | <b>B1</b> |            |
|            | <b>U2</b> | <b>B2</b> |            |
| CAN0_CON_L | <b>U3</b> | <b>B3</b> | CAN1_CON_L |
| CAN0_CON_H | <b>U4</b> | <b>B4</b> | CAN1_CON_H |
| GND_DIG    | <b>U5</b> | <b>B5</b> | GND_DIG    |
|            | <b>U6</b> | <b>B6</b> |            |

\*By default, 6P4C connector is mounted so pins 1 and 6 will not be accessible.

Top port RS232 can also be used for debug console purpose.

|--|--|

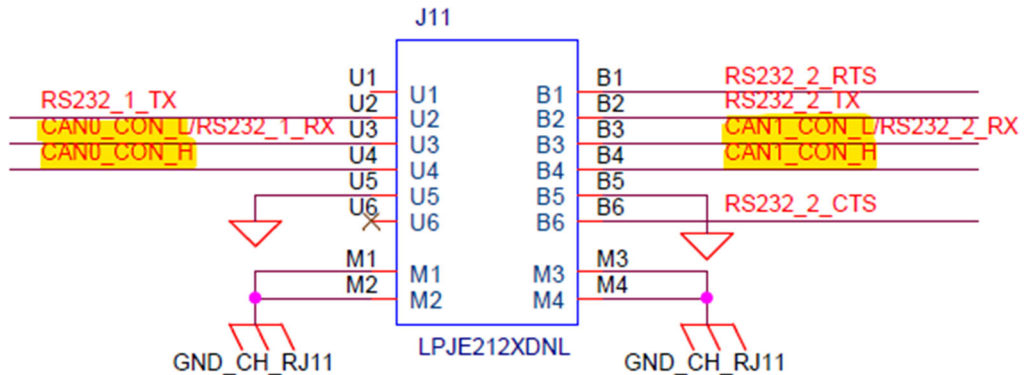

Figure 15: Schematic example for CAN connector on Panel IO Board

### 5.2.10 SPI and I2C Connectors on Osbourne Commercial IO Board

The utility connector provides access to SPI and I2C. Both interfaces are 3.3V level.

The pinouts are as shown below

|                   |   |    |                 |
|-------------------|---|----|-----------------|
| V_3P3             | 1 | 2  | I2C_GP8_CLK_3P3 |
| BUTTON_POWER_ON_N | 3 | 4  | I2C_GP8_DAT_3P3 |
| GND               | 5 | 6  | SPI_CLK         |
| SYS_RST_IN_N      | 7 | 8  | SPI_MISO        |
| SPI_CS0           | 9 | 10 | SPI_MOSI        |

**Figure 16: Schematic example for CAN connector on Panel IO Board**

## 6. APPENDIX

### 6.1 Jumper Configuration on Osbourne Base Board

#### 6.1.1 JP1 Jumper Configuration

JP1 Jumpers Configuration are provided enable and disable the termination of serial ports1-2.

| Position             | Function  | IN      | OUT              |
|----------------------|---|---------|------------------|
| TX1                  | 121E Termination Enabled for SER1 TX RS-485/RS-422 Mode | Enabled | <b>Disabled*</b> |
| RX1                  | 121E Termination Enabled for SER1 RX RS-485/RS-422 Mode | Enabled | <b>Disabled*</b> |
| TX2                  | 121E Termination Enabled for SER2 TX RS-485/RS-422 Mode | Enabled | <b>Disabled*</b> |
| RX2                  | 121E Termination Enabled for SER2 RX RS-485/RS-422 Mode | Enabled | <b>Disabled*</b> |
| <b>*Default Mode</b> |   |         |                  |

#### 6.1.2 JP2 Jumper Configuration

JP2 Jumpers are provided to select the voltage level and Pullup/pull down configuration of the DIO. By default, the DIOs are 3.3 Volare pulled down. The configuration is as shown below:

| Position             | Function             | IN              | OUT      |
|----------------------|----------------------|-----------------|----------|
| 5V                   | DIO Voltage Level    | 5V              |          |
| 3V3                  | DIO Voltage Level    | <b>3.3V*</b>    |          |
| PU                   | DIO Pull up Enable   | Enabled         | Disabled |
| PD                   | DIO Pull down Enable | <b>Enabled*</b> | Disabled |
| <b>*Default Mode</b> |                      |                 |          |

*Note: Make sure 5V and 3V3 Jumper are not IN at same time.*

#### 6.1.3 JP3 Jumper Configuration

JP3 Jumpers Configuration are provided to select the Boot configuration, x16 PCIe or MINICARD, Wake on LAN selection and auto power selection. The configuration is as shown below:

| Position             | Function                      | IN        | OUT                |
|----------------------|-------------------------------|-----------|--------------------|
| PCIE                 | x16 PCIE / MINICARD Selection | x16 PCIE  | <b>MINICARD*</b>   |
| CFG                  | Boot Configuration            | Config #2 | <b>Config #1 *</b> |
| WOL                  | Wake on LAN                   | Enabled   | <b>Disabled*</b>   |
| AUTO                 | Auto Power                    | Enabled   | <b>Disabled*</b>   |
| <b>*Default Mode</b> |                               |           |                    |

### 6.2 Jumper Configuration on Osbourne Carrier Board

#### 6.2.1 CAN/Serial/DIO Jumper (JP1)

The Jumper block JP1 on the Commercial IO board is used to configure the IO connectors on the front panel to Serial Port/GPIO on DB9M Top port, CAN/Serial Port on RJ11 port. Fixed Configuration board is also based on the ordering part number.

The following table describes the Jumper Block on the Commercial Io board.

| Position             | Function                     | IN     | OUT  |
|----------------------|------------------------------|--------|------|
| SEL1                 | Serial/CAN (J11 Bottom Port) | Serial | CAN* |
| SEL2                 | Serial/CAN (J11 Top Port)    | Serial | CAN* |
| SEL3                 | Serial/DIO (J16 Top Port)    | Serial | DIO* |
| <b>*Default Mode</b> |                              |        |      |

### **6.3 Schematic and BOM of Osbourne Carrier Board for reference**

Please contact DSC for complete details on schematic and BOM of Osbourne Commercial IO board.
